Project Overview

This project presents a comprehensive testing process performed on the Airbnb mobile application as part of an STR (Software Testing & Reporting) project. The main objective was to evaluate the overall quality of the application, including functionality, usability, performance, and system reliability under real user conditions.

Testing Scope

The testing covered the main user flows within the application, including navigation, search functionality, booking processes, messaging, and profile management. In addition, special attention was given to system behavior in different scenarios such as network changes, background activity, device settings, and edge cases that may impact the user experience.

Tools and Methodology

Throughout the project, industry-standard tools were used to simulate a real QA work environment:

- **TestRail** was used for writing and executing test cases, as well as tracking testing progress.

- **Jira** was used for reporting, documenting, and managing bugs, including prioritization and assignment.

This approach allowed full traceability between tests and defects and ensured an organized and efficient workflow.

Advanced Testing

Beyond standard functional testing, additional testing types were performed:

UI/UX Testing using developer tools to analyze layout, alignment, and visual behavior

Performance Testing under different network conditions to evaluate responsiveness and stability

Exploratory Testing to identify unexpected issues and real-world usability problems

Project Goal

The purpose of this project is to demonstrate a complete testing cycle — from planning and execution to analysis and reporting.

The results provide valuable insights into the strengths and weaknesses of the application and highlight areas that require improvement before release.

The testing was conducted on a real mobile device to ensure accurate validation under real user conditions:

Device: Samsung Galaxy S24 Ultra

Operating System: Android 16

UI Version: One UI 8.0

In addition to standard functional testing, developer tools were used to monitor system behavior, logs, and identify potential issues during execution.

Performance testing was carried out under different network conditions, including **5G mobile** data and **Wi-Fi**, to evaluate app responsiveness, loading times, and stability.

Additional scenarios were tested to simulate real user behavior, including:

Running the application while multiple apps were open in the background

Testing under **battery saver mode** to evaluate performance limitations

Changing device date and time settings to check system reliability and security behavior

All tests were executed on a physical device to reflect real-world performance, usability, and user experience.

Bottom Navigation Bar

Quality Management with TestRail

TestRail was used to manage and execute mobile test cases for the **Airbnb** application, track real-time progress, and analyze system quality through reports.

The testing focused on key user flows such as navigation, search, booking, and app behavior under different conditions.

Test Run Analysis (March, 2026)

Total Tests: 444

Passed: 298 (67%)

Failed: 35 (8%)

Blocked: 66 (15%)

Skipped: 45 (10%)

Summary:

The results show a moderate level of stability — most core features are working properly, but there are still issues and blocked scenarios that need further investigation and fixes before release.

Bug Reporting and Tracking

All failed tests were reported and tracked in Jira, with direct linkage between test cases and defects.

This ensured clear communication between QA and developers and efficient issue handling.

Test Coverage

The testing covered the main areas of the Airbnb mobile app:

Home Screen & Navigation: UI, responsiveness, and usability

Search & Explore: filters, location accuracy, and results

Booking Flow: reservation process and edge cases

Notifications & System Behavior: app performance, interruptions, and background behavior

ScreenShot from TestRail

In the screenshots attached below you can see the actual work with Testrail.

Analyzing the results of running TestRail tests

Explanation of tests in Testrail

Test quantity	Result type	Solution	Reason
298	Passed	Good vibes	Amazing vacation
66	Blocked	Notes	It was not possible to verify that a real order was not placed.
45	Skipped	Notes	Tests written in the same style or not relevant tests.
35	Failed	Bug report	To report, track, and fix issues.

Quality Assurance & Management via Jira

As part of this project, I chose to use Jira, the world's leading platform for project management and bug tracking.

Using this system allowed me to simulate a real-world development environment, enabling precise documentation of issues, priority management, and status tracking.

Bug Reporting and Documentation

For every bug identified, I created a detailed "Issue" (ticket) which includes:

- Description: A clear explanation of the problem.
- Steps to Reproduce: A step-by-step guide on how to trigger the bug.
- Expected vs. Actual Result: A comparison between how the system should behave and what actually happened.
- Screenshots: Visual evidence (as seen in the gallery) highlighting the exact location of the fault.
- Priority & Severity: Determining the urgency of the bug (High/Medium/Low) based on its impact on the user experience.

Team Simulation

To make the project more engaging and realistic, I created fictional users within the system to represent different roles, such as Developers, UI/UX Designers, and a Project Manager.

For every bug reported, I used the Assignee feature to assign the ticket to the relevant person responsible for the fix based on their role.

Note: These assignments were made for simulation purposes only to demonstrate my management skills within the software. In practice, no actual fixes were performed by these users; the focus remained on the reporting and task allocation process.

Screenshot from Jira

In the screenshots attached below you can see the actual work with Jira.

Assigning bug fixes to the recipient

To make the project more interesting, I created fictitious users in Jira and added them to the project. I assigned the handling of each bug to each developer/designer in the company.

Assignee	Bugs to fix
Maya Product Manager	5
Tom Backen Developer	24
Ela UI UX Designer	3
Ruth Android Developer	2

UI/UX Testing via Developer Tools

As part of the STR (Standard Testing & Reporting) project for the **Airbnb** mobile application, I performed in-depth interface and user experience evaluations.

Testing Tools: Utilized Android Developer Options and enabled Show Layout Bounds to inspect the application's structural framework.

Testing Scope:

Padding & Alignment: Verified consistency in spacing between text elements and action buttons (e.g., Edit/Add).

Component Hierarchy: Analyzed the rendering of dynamic lists (Amenities) and input fields.

Overlap Detection: Identified element crowding and overlapping UI components within the Map View that hinder accessibility.

Empty State Validation: Evaluated interface behavior and layout integrity for fields with no provided data.

Performance testing

5G Network Rendering Performance Analysis

Objective: Evaluate screen rendering and GPU performance using a high-speed 5G connection.

Methodology: Monitor GPU profiling bars against the 16ms threshold (60 FPS) while interacting with the application.

Findings: Identified noticeable performance drops (spikes) during the initial load and scrolling of content-heavy screens.

Image 1- map View: A critical rendering spike was observed, exceeding the screen width. This suggests a GPU rendering bottleneck, likely caused by overdraw or complex map layers, unrelated to network download speed.

Image 2- explore Tab: Regular spikes were detected while scrolling, indicating a lag in uploading new image textures to the GPU, even with fast network throughput.

Image

1

Image

2

Performance testing

Wi-Fi Network Rendering Performance Analysis

Objective: Evaluate screen rendering and GPU frame times using a stable Wi-Fi connection.

Methodology: Monitored the Profile GPU Rendering bars during critical user checkout flows to identify potential lags in the interface.

Findings:

Image 1- checkout summary: A distinct rendering spike was observed upon loading the "Review and continue" screen. This indicates a momentary frame drop as the device renders multiple text styles and dynamic pricing data over the network.

Image 2- guest selection: The layout remains mostly stable and under the 16ms threshold, showing that simple selection screens perform efficiently on this network and device configuration.

Image

Image
2

Improve Stability and Reduce Failures

Based on the test results, several failed test cases indicate functional issues that directly affect the user experience.

It is recommended to prioritize fixing critical and major bugs, especially in core flows such as login, search accuracy, and booking logic.

Handle Blocked Scenarios More Effectively

A significant number of tests were marked as Blocked, mainly due to limitations in verifying real booking and payment scenarios.

To improve coverage, it is recommended to:

- Use test environments with mock payments or sandbox systems
- Create dedicated test accounts for end-to-end flow validation

Enhance Input Validation and Error Handling

Several issues were found related to incorrect inputs (e.g., invalid email, search inputs, number of guests). The system should provide clear validation rules and user-friendly error messages to prevent unexpected behavior.

Improve Performance and Rendering Stability

Performance testing revealed rendering spikes and minor delays during heavy screens such as maps and content-rich pages.

It is recommended to:

- Optimize UI rendering and reduce GPU load
- Improve handling of large data and images
- Ensure smoother scrolling and transitions

Strengthen Security and Session Management

Security-related issues were identified, such as session persistence after long inactivity or incorrect handling of user data.

In addition, since the application stores sensitive information such as payment methods, it is recommended to:

- Implement biometric authentication (fingerprint / face recognition)
- Enforce session expiration rules
- Improve authentication and verification mechanisms

Enhance User Experience (UX/UI)

Some usability gaps were identified in areas such as notifications, wishlist behavior, and feature clarity.

It is recommended to:

- Improve feedback to users (messages, alerts, confirmations)
- Ensure consistency across screens
- Make key actions more intuitive and accessible

Expand Test Coverage

To further improve quality, it is recommended to expand testing in the following areas:

- Edge cases and unusual user behaviors
- Cross-device and tablet compatibility
- Additional performance and stress testing

This project presented a full testing process of the **Airbnb** mobile application, including execution, analysis, and reporting.

The results show a moderate level of stability — while many core features are functioning properly, several issues, failed tests, and blocked scenarios still impact the overall quality and reliability of the system.

Although the application demonstrates strong functionality, it does not yet meet the required standards for a production release.

Exit Criteria – NO GO

The application is not approved for release (NO GO) due to the following reasons:

- Presence of critical and major bugs that affect core functionality
- Failures in key user flows such as login, search, and booking scenarios
- A high number of blocked tests, limiting full validation of end-to-end processes
- Identified performance issues in complex screens
- Security gaps, including lack of biometric protection for sensitive actions

👉 Therefore, additional fixes, validations, and re-testing are required before the application can be considered ready for release.

Test details from TestRail

T151	When using a price filter (min/max), the displayed results are within the defined range.		AIRBNB -6	Homes	Failed
T152	Selecting the "Self check-in" filter does not bring up regular check-in results.			Homes	Passed
T153	Selecting the "Free parking" filter does not bring up paid parking results.			Homes	Passed
T154	Selecting the "Washer" filter only brings up results for places that have a washing machine.			Homes	Passed

Test details from TestRail

Page 4/23

T155	In "Type of place", selecting a room does not show an entire property and vice versa.			Homes	Passed
T156	Entering a 0 value in the minimum field triggers an automatic correction to a certain amount.			Homes	Passed
T157	Entering a 0 value in the maximum field triggers an automatic correction to a price higher than the minimum.			Homes	Passed
T158	Selecting the number of rooms/beds/bathrooms in the "Rooms and beds" filter shows only matching results.			Homes	Passed
T159	It is possible to book a stay of more than 28 days (long-term rental), and the price changes according to monthly discounts.			Homes	Passed
T160	When moving the map ("Search as I move the map"), results refresh in less than 2 seconds.			Homes	Passed
T161	The system hides the exact location of the property (house number) until after the booking is made.			Homes	Passed
T162	Places offering accessibility actually appear according to the request.			Homes	Passed
T163	When trying to book a property for 0 guests, the system displays an error message that no guests were selected.		AIRBNB -7	Homes	Failed
T164	Is it possible to delete recent searches from the list?	No, these are probably the app settings.		Homes	Skipped
T165	Searching for a destination with no properties (e.g., "Antarctica") displays a friendly "No results found" message.			Homes	Failed
T166	For an Israeli citizen booking an apartment for 4 months in Europe, the system pops up a reminder that the stay for Israelis is limited to 90 days.		AIRBNB -9	Homes	Failed
T167	Multiple filters can be selected at once (e.g., both a pool and free parking).			Homes	Passed
T168	Filtering by "Host languages" works.			Homes	Passed
T169	The "Instant Book" filter shows only properties that do not require host approval.			Homes	Passed
T170	It is possible to sort by "Highest rating".	No		Homes	Skipped
T171	The map displays price bubbles on every property.			Homes	Passed
T172	When clicking a price bubble on the map, the property opens in a preview.			Homes	Passed
T173	Photos in the search results can be scrolled through without entering the property page.			Homes	Passed
T174	The system displays "Similar results" if the exact search did not yield many results.			Homes	Passed

Test details from TestRail

Page 5/23

T175	The results page loads in less than 3 seconds.			Homes	Passed
T176	The system remembers the last filters if the user leaves the app and returns.			Homes	Passed
T177	Search results can be shared with a friend.			Homes	Passed
T178	Text size on the map is readable.			Homes	Passed
T179	You can switch from list view to map view with one click.			Homes	Passed
T180	Typing "New York" in the search field brings results only for "New York" and not another state.			Where?	Passed
T181	Typing a country/city like "New Yorkkkkkkk", the system identifies it as "New York".		AIRBNB -10	Where?	Failed

Severity:	S2 - Critical

Description

T131:

Steps to reproduce:

1. Open the App and Log in
2. Go out from the App (without closing)
3. Go to Mobile Settings> General Management> Date and Time> Disable Automatic Date and Time> Set Date> Select a date 4 months in the future
4. Return to the app

Actual result:
The app shows an error, does not request a new login. And even after returning to the current date, it did not request a new login.

Expected result:
The app recognizes that 4 months have passed and requires a new login.

Note:
The app was not active for me for a few months and when I opened it again, I was logged in.

Original estimate:	Not Specified		
Environment:	Device: SamsungGalaxy S24 Ultra		
	Android Version: 16		
	One UI Version: 8.0		

Severity:	 S5 - Low
-----------	--

Description

T197:

Steps to reproduce:

1. Open the App and Login
2. In the search option, enter "Spain" 3. When selecting dates: Click on one date several times and then try to create a range of dates.

Actual result:

The app cancels the specific date selected for the range.

Expected result:

The app does not cancel the specific date selected for the range.

[AIRBNB-16] [When adding the maximum number of adults, children \(2-12\) can also be added.](#)

Attachments:	 _testrail-s3-attachments_10001230_29-Children 2-12.jpg
Severity:	 S3 - Major

Description

T217:

Steps to reproduce:

1. Open the App and Log in
2. In the search option,enter "New york city", random dates
3. Selecting the maxadults
4. Try to selecting children

Actual result:
When selecting maximum adults, children cannot be added.

Expected result:
When choosing maximum adults, children can be added

The image is a screenshot of the Airbnb mobile app's search interface. At the top, there's a navigation bar with icons for 'Homes', 'Experiences', and 'Services'. Below this, the search parameters are set to 'Where: New York City' and 'When: Jun 1 - 8'. The 'Who?' section shows 'Adults: 16+' (Ages 13 or above), 'Children: 0' (Ages 2 - 12), 'Infants: 0' (Under 2), and 'Pets: 0' (Bringing a service animal?). A red box highlights the 'Children' section with the text 'When selecting maximum adults, children cannot be added.' Red arrows point from this text to the minus and plus buttons of the 'Children' count, indicating that these buttons are disabled. At the bottom, there are 'Clear all' and 'Search' buttons. The Airbnb logo is in the bottom left corner, and a house icon with the number '75' is in the bottom center. The background of the entire image is a light blue map of the United States.

The screenshot displays the Airbnb search interface on a mobile device. At the top, the status bar shows the time 15:20, signal strength, and battery level at 96%. The navigation bar includes icons for Homes, Experiences, and Services, with a close button (X) on the right. Below the navigation bar, the search criteria are displayed: "Where" is set to "New York City", and "When" is set to "Jun 1 - 8".

The "Who?" section is expanded, showing the number of guests for different categories:

- Adults (Ages 13 or above): 16+ (Maximum)
- Children (Ages 2 - 12): 0
- Infants (Under 2): 0
- Pets (Bringing a service animal?): 0

A red box highlights the "Children" section with the text: "When selecting maximum adults, children cannot be added." Red arrows point from this text to the "Children" and "Adults" guest count controls, indicating the bug.

At the bottom of the search bar, there is a "Clear all" button and a "Search" button. The bottom of the screen shows the standard Android navigation bar with three icons: a home button, a circle, and a back arrow.

The Airbnb logo is visible in the bottom left corner, and a red house icon with the number "75" is in the bottom center. A small airplane icon is in the bottom right corner.

[AIRBNB-17] [There is no limit on the number of infants.](#) Created: 26/Mar/26 Updated: 26/Mar/26

Attachments:	 _testrail-s3-attachments_10001230_30-Babies.jpg
Severity:	 S3 - Major

Description

T218:

Steps to reproduce:

1. Open the App and Login
2. In the search option,enter "New york city", random dates
3. Selecting 7 adults
4. Try to Selecting more then 5 babies

Actual result:

You cannot select more than 5 babies.

Expected result:

You can select more than 5 babies.

The image is a screenshot of a mobile application interface, specifically the search page of Airbnb. At the top, there's a status bar showing the time 15:20, signal strength, and battery level at 96%. Below the status bar, there are three main navigation icons: 'Homes' (a house icon), 'Experiences' (a hot air balloon icon), and 'Services' (a bell icon). The 'Homes' icon is currently selected and underlined. To the right of these icons is a close button (an 'X' in a circle). Below the navigation bar, there are two input fields: 'Where' with the text 'New York City' and 'When' with the text 'Jun 1 - 8'. Below these fields is a section titled 'Who?' which contains three rows of selection controls. The first row is for 'Adults' (Ages 13 or above) with a minus button, the number '7', and a plus button. The second row is for 'Children' (Ages 2 - 12) with a minus button, the number '0', and a plus button. The third row is for 'Infants' (Under 2) with a minus button, the number '5', and a plus button. A red rectangular box highlights the 'Infants' row, and a red callout box with white text points to the plus button, stating 'You cannot select more than 5 babies.' Below the 'Infants' row is a row for 'Pets' (Bringing a service animal?) with a minus button, the number '0', and a plus button. At the bottom of the search section, there are two buttons: 'Clear all' and a red 'Search' button with a magnifying glass icon. The bottom of the screen shows the standard Android navigation bar with three icons: a square, a circle, and a triangle. The entire screenshot is framed by a red border with decorative elements like a house icon in the top left and a location pin in the top right. At the bottom of the frame, there is a red 'airbnb' logo on the left, a house icon with the number '77' inside on the center, and a small airplane icon on the right.

The image is a screenshot of the Airbnb mobile app interface. At the top, there's a navigation bar with icons for 'Homes' (selected), 'Experiences', and 'Services'. Below this is a search bar with 'Where' set to 'New York City' and 'When' set to 'Jun 1 - 8'. The 'Who?' section shows 'Adults' (7), 'Children' (0), and 'Infants' (5). A red box highlights the 'Infants' count, and a red text box with an arrow pointing to it says 'You cannot select more than 5 babies.' At the bottom, there's a 'Clear all' button and a red 'Search' button. The Airbnb logo is at the bottom left, and a house icon with the number '77' is at the bottom center.

[AIRBNB-18] [The search result matches the number of people selected](#)

Severity:	S3 - Major

Description

T385:

Steps to reproduce:

1. Open the App and Log in
2. In the search option, enter "472 Manila Ave, NJ, USA", random dates
3. Click on the place and scroll down to the description and read
4. Open Google map and plan a trip from the listed address to Lower Manhattan.

Actual result:
The trip to lower Manhattan by car or train takes much longer than the 7 minutes stated in the description. (It takes around 20-30 minutes)

Expected result:
The description should say that the trip to lower Manhattan takes longer - about 20-30 minutes.
